COMPOUNDS AND METHODS FOR INHIBITION OF
HIV AND RELATED VIRUSES

5 This application is a continuation-in-part of
application serial No. 07/739,927, filed on August 2, 1991.

Field of the Invention

10 The present invention relates to compounds and
pharmaceutically acceptable salts thereof and processes for
treating infections by HIV and related viruses and/or the
treatment of Acquired Immune Deficiency Syndrome (AIDS).
This invention also relates to pharmaceutical compositions
15 containing the compounds and the method of use of the
present compounds alone or in combination with other
agents, for the treatment and inhibition of AIDS and viral
infection from HIV.

Background of the Invention

20 A retrovirus designated Human Immunodeficiency
Virus (HIV) is believed to be the causative agent of the
complex disease termed Acquired Immune Deficiency Syndrome
(AIDS) and is a member of the lentivirus family of
25 retroviruses (M. A. Gonda, F. Wong-Staal NR. C. Gallo,
"Sequence Homology and Morphological Similarity of HTLV III
and Visna Virus, A Pathogenic Lentivirus", Science, 227,
173, (1985); and P. Sonigo and N. Alizon, et al.,
"Nucleotide Sequence of the Visna Lentivirus: Relationship
30 to the AIDS Virus", Cell, 42, 369, (1985)). The HIV virus
(also referred to as the AIDS virus) was previously known

-2-

as or referred to as LAV, HTLV-III, or ARV, and is now designated by HIV-1. Other closely related variants of HIV-1 include HIV-2 and SIV (simian immunodeficiency virus), and mutants thereof.

5 The complex disease AIDS includes progressive destruction of the immune system and degeneration of the central and peripheral nervous system. The HIV virus appears to preferentially attack helper T-cells (T-lymphocytes or OKT4-bearing T-cells) and also other human
10 cells, e.g., certain cells within the brain. The helper T-cells are invaded by the virus and the T-cell becomes an HIV virus producer. The helper T-cells are quickly destroyed and their number in the human being is depleted to such an extent that the body's B-cells as well as other
15 T-cells normally stimulated by helper T-cells no longer function normally or produce sufficient lymphokines and antibodies to destroy the invading virus or other invading microbes.

20 While the HIV virus does not necessarily cause death per se, it does cause the human's immune system to be so severely depressed that the human falls prey to various other diseases such as herpes, Pneumocistis carinii, toxoplasmosis, cytomegalovirus, Kaposi's sarcoma, and Epstein-Barr virus related lymphomas among others. These
25 secondary infections are separately treated using other medications as is conventional. Early during infection, humans with HIV virus seem to live on with little or no symptoms, but have persistent infections. Later in the disease, humans suffer mild immune system depression with
30 various symptoms such as weight loss, malaise, fever, and swollen lymph nodes. These syndromes have been called

-3-

persistent generalized lymphadenopathy syndrome (PGL) and AIDS related complex (ARC) and develop into AIDS.

In all cases, those infected with the AIDS virus are believed to be persistently infective to others.

5 Further, AIDS and AIDS related complex is after some time fatal.

A description of the mechanism by which the virus infects its host is given in an article by R. Yarchoan, and S. Broder, "Development of Antiretroviral Therapy for the Acquired Immunodeficiency Syndrome and
10 Related Disorders", New England Journal of Medicine, 316, 557-564 (February 26, 1987).

Considerable efforts are being directed toward the control of HIV by means of inhibition of the reverse
15 transcriptase of HIV, required for replication of the virus. (V. Merluzzi et al., "Inhibition of the HIV-1 Replication by a Nonnucleoside Reverse Transcriptase Inhibitor", Science, 25, 1411 (1990)). For example, a
20 currently used therapeutic compound, AZT, is an inhibitor of the viral reverse transcriptase (U.S. Patent No. 4,724,232). Unfortunately, many of the known compounds suffer from toxicity problems, lack of bioavailability or are short lived in vivo, viral resistance, or combinations thereof.

25 Therefore it is an object of the invention to provide compounds and pharmaceutically acceptable salts thereof to inhibit and/or treat HIV and AIDS.

Another object of the present invention is to provide therapeutic formulations that are of value in the
30 inhibition and/or treatment of infection by HIV and the

-4-

treatment or inhibition of the acquired immune deficiency syndrome.

Another object is to provide methods for the inhibition and/or treatment of infection by HIV and the resulting acquired immune deficiency syndrome.

Other objects, features, and advantages will become apparent to those skilled in the art from the following description and claims.

Description of the Invention

The present invention provides compounds useful for the inhibition and/or treatment of HIV and AIDS, either as compounds, pharmaceutically acceptable salts, pharmaceutical composition ingredients, whether or not in combination with other anti-virals, immunomodulators, antibiotics, or vaccines. Especially preferred is N-[2-(2-pyridyl)ethyl]-N'-[2-(5-bromo)pyridyl]thiourea, and its hydrochloride salt.

As mentioned above, the invention includes pharmaceutically acceptable salts of the compounds defined by the above formula (I). Although generally neutral, a

particular compound of this invention can possess a sufficiently acidic, a sufficiently basic, or both, functional groups, and accordingly react with any of a number of nontoxic inorganic bases, and nontoxic inorganic and organic acids, to form a pharmaceutically acceptable salt. Acids commonly employed to form acid addition salts are inorganic acids such as hydrochloric acid, hydrobromic acid, hydroiodic acid, sulfuric acid, phosphoric acid and the like, and organic acids such as p-toluene sulfonic, methanesulfonic acid, oxalic acid, p-bromophenylsulfonic acid, carbonic acid, succinic acid, citric acid, benzoic acid, acetic acid, and the like. Examples of such pharmaceutically acceptable salts thus are the sulfate, pyrosulfate, bisulfate, sulfite, bisulfite, phosphate, monohydrogenphosphate, dihydrogenphosphate, metaphosphate, pyrophosphate, chloride, bromide, iodide, acetate, propionate, decanoate, caprylate, acrylate, formate, isobutyrate, caproate, heptanoate, propiolate, oxalate, malonate, succinate, suberate, sebacate, fumarate, maleate, butyne-1,4-dioate, hexyne-1,6-dioate, benzoate, chlorobenzoate, methylbenzoate, dinitrobenzoate, hydroxybenzoate, methoxybenzoate, phthalate, sulfonate, xylenesulfonate, phenylacetate, phenylpropionate, phenylbutyrate, citrate, lactate, g-hydroxybutyrate, glycollate, tartrate, methanesulfonate, propanesulfonate, naphthalene-1-sulfonate, naphthalene-2-sulfonate, mandelate and the like. Preferred pharmaceutically acceptable acid addition salts are those formed with mineral acids such as hydrochloric acid and hydrobromic acid, and those formed with organic acids such as maleic acid and methanesulfonic acid.

Base addition salts include those derived from inorganic bases, such as ammonium or alkali or alkaline earth metal hydroxides, carbonates, bicarbonates, and the like. Such bases useful in preparing the salts of this invention thus include sodium hydroxide, potassium hydroxide, ammonium hydroxide, potassium bicarbonate, calcium hydroxide, calcium carbonate, and the like.

The pharmaceutically acceptable salts of the invention are typically formed by reacting a compound as defined with an equimolar or excess amount of acid or base. The reactants are generally combined in a mutual solvent such as diethyl ether or benzene, for acid addition salts, or water or alcohols for base addition salts, and the salts normally precipitate out of solution within about one hour to about ten days and can be isolated by filtration or other conventional methods. The salts of the compounds of the invention will convert to the compound per se after administration and are thus prodrugs. All prodrugs are administered in an amount sufficient to generate an effective amount of the compound to contact the virus and interact with it (e.g. inhibit replication thereof).

The compounds of the present invention also include racemates, racemic mixtures, and individual enantiomers or diastereomers. All asymmetric forms, individual isomers and combinations thereof are within the scope of the present invention.

As noted, the optically active diastereomers of the compounds of Formula 1 are considered part of this invention and such optically active isomers may be prepared from their respective optically active precursors by the procedures described herein, or by resolving the racemic

mixtures. The resolution can be carried out in the presence of a resolving agent, by chromatography, by repeated crystallization or by some combination of these techniques which are known to those skilled in the art.

5 Further details regarding resolutions can be found in Jacques, et al., Enantiomers, Racemates, and Resolutions, John Wiley & Sons 1981.

10 The compounds of the present invention, or their precursors, are prepared using procedures known to those of ordinary skill in art. More particularly, the compounds of Formula (1) are prepared according to the procedures shown below in Schemes I, II, and III, and as described following the Schemes.

15

SCHEME I

-122-

In Scheme I, a derivative of isothiocyanate (1) is reacted with an amino group (2) in approximately 1:1 molar ratio, in an inert organic solvent such as N,N-dimethyl formamide and stirred at an appropriate temperature of between about 0-150°C for a period of time between about 1 and 72 hours. The time and temperature used depends upon the reactivity of the individual reagents. The product (3) may be isolated by conventional techniques.

Scheme II

Scheme II is run under the same general reaction conditions as Scheme I.

Scheme III

5 Scheme III is a process analogous to that described in J. Org. Chem., Vol. 49, 4123 (1984) herein incorporated by reference.

10 The compounds employed as initial starting materials in the synthesis of the compounds of this invention are well known and, to the extent not commercially available, are readily synthesized by standard procedures commonly employed by those of ordinary skill in the art.

15 Other teaching for preparing the compounds of the invention may be found in Organic Synthesis, 45, 69 (1965); Synthesis, 289 (1974); Journal of the American Chem. Society, 79, 1236 (1957); and Organic Synthesis, 20, 69, (1940), and Synthesis, May 1983, p. 391, incorporated herein by reference.

20 Tests with the above compounds of Formula 1 have indicated activity as inhibitors of HIV. While not being bound by theory, it is believed that the compounds act as

-124-

reverse transcriptase inhibitors, and thereby act to inhibit replication of the virus.

The following is a description of the test systems used in analyzing compounds in effectiveness against HIV.

Tests A, B, C, and D (XTT)

MT4 cells in a medium of RPMI 1640, 5% FCS, penicillin/streptomycin are adjusted to 2×10^5 cells/ml and seeded into microplates (96 wells/plate) 100 ml cell suspension/well giving 2×10^4 cells/well. The compound to be tested is made into a 10 mg/ml mixture in DMSO and stored at -20°C . The compound in DMSO is diluted with medium containing 10% DMSO in a 10-fold dilution series to give 1 mg/ml, 10 mg/ml, and 100 mg/ml solutions. Further dilutions to 400, 40, 4 and 0.4 mg/ml are made in medium containing microplates. Fifty ml of the 400, 40, and 4 mg/ml are transferred to the cell-containing microplates with a multi-channel pipette (final concentration: 100, 10, and 1 mg/ml). Finally, 50 ml of virus suspension is added to each well (with a repetitive "Eppendorf" multipipett). Each plate has at least six wells with the following: [Test A: HIV virus; Test B: HIV(II) virus; Test C: SIV virus; Test D: No virus]; with no drug (virus control) and six wells without virus (medium control). The plate is put into a plastic bag and incubated for six days in CO_2 atmosphere. To each well in the plate is added 50 ml of XTT ((2,3-bis[2-methoxy-4-nitro-5-sulfo-phenyl]-5-[(phenylamino)carbonyl]-2H-tetrazolium hydroxide), (1 mg/ml 0.01-0.02 mM N-methyl-phenazonium methosulfate). After six hours of incubation in CO_2 atmosphere the plates are covered with adhesive plate sealers and gently mixed on a

-125-

vortex. Optical densities are determined at a wavelength of 450 nm and a reference wavelength of 650 nm. The percent reduction of cytotoxicity caused by the virus infection is calculated as follows:

5

$$\frac{\text{OD}_{450} \text{ compound} - \text{OD}_{450} \text{ inf cells}}{\text{OD}_{450} \text{ uninfl cells} - \text{OD}_{450} \text{ inf cells}} \times 100$$

10

Tests E, F, G, H (HIV-IRT, HIV-2RT, SIVRT, no virus)

MT-4/H9-cells are adjusted to 2×10^5 cells/ml medium (RPMI 1640, 5% FCS, penicillin/streptomycin) and seeded into microplates (96 wells/plate) 100 μ l cell suspension/well giving 2×10^4 cells/well. The compound to be tested is made 10 mg/ml in DMSO = stock solution (stored at -20°C). The compound dissolved in DMSO is diluted 25 times in medium to give 400 mg/ml. Further dilutions to 40 mg/ml and 4 mg/ml are made in microplates.

15

20

50 μ l of the dilutions 400 mg/ml, 40 mg/ml and 4mg/ml are transferred to the "cell-containing" microplate with a multichannel pipette. (Final concentration: 100, 10 and 1 mg/ml).

25

Finally 50 μ l of virus suspension is added to each well (with a repetitive "Eppendorf multipipette"). [Test E-HIV-1; Test F-HIV-2; Test G-SIV; Test H-no virus].

30

Each plate has at least four wells with virus but no drug (virus control) and two wells without virus (medium control). The plate is put into a plastic bag to avoid evaporation and incubated for six days in CO_2 -atmosphere. 10 μ l supernatant from each well is transferred with a multichannel pipette into a new

-126-

microplate to which 40 ml VDB, (50 mM Tris-HCl pH = 7.6, 35 mM KCl, 4 mM DTT, 1 mM EDTA, 1.3% Triton X-100), have been added to each well. The addition of 50 ml RT-reaction mix, (10 ml culture supernatant, 40 ml VDB and 50 ml reaction mixture giving a final concentration of: 100 mM Tris-HCl pH = 7.6, 100 mM KCl, 4 mM MgCl₂, 4 mM DTT, 275 mg/ml BSA/ml, 5 mg (rA)_n(dT)₁₂₋₁₈/ml and 0.3 mM ³H dTTP (specific activity 18.000 cpm/pmol)) gives a final volume of 100 ml/well. After 60 minutes of incubation the whole assay volume is transferred by use of a cell harvester to a filter mat prewetted with 5% TCA. The filter is washed in 5% TCA and rinsed once in ethanol. After drying the filter mat at 60°C for 30 min. each filter (96/mat) is punched out and put into counting vials 2 ml of scintillation fluid is added and the samples are counted (1 min) or the whole filter mat is put into a plastic bag, 10 ml of scintillation fluid is added and the filter mat is counted in a Beckman Betaplate counter. Percent reduction of RT activity is determined by comparing RT activity for virus control with the RT activity measured for each dilution of the compound.

Test I (HIVRT (rAdt))

The compounds were tested for direct inhibitory activity on HIV-RT in a volume of 100 ml recombinant HIV-RT (diluted in virus disruption buffer to give 200.000 cpm).

100 mM Tris-HCl pH 7.6, 100 mM KCl, 4 mM MgCl₂, 4 mM DTT, 275 mg/ml BSA, 0.5 mg (rA)_n(dT)₁₂₋₁₈ and 0.3 mM ³H--dTTP (specific activity 18.000 cpm/mol). After 60 minutess of incubation 40 ml in duplicate were spotted on paper discs and washed in 5% TCA. After rinsing the paper

-127-

discs in ethanol they were dried and counted in scintillation fluid.

The following Tables illustrate activities of compounds in the above-described tests. The numbers represent % inhibition.

-145-

A feature of this invention also disclosed is a method of administering to a human in need thereof the compounds of the invention or their pharmaceutically acceptable salts to treat or inhibit HIV/AIDS, to inhibit the replication of the HIV/AIDS virus in infected human cells and to inhibit AIDS from developing in humans infected with the HIV/AIDS virus or carrying antibodies to the HIV/AIDS virus.

The present invention also discloses the compounds of the invention and their salts for use in the treatment of the condition referred to above, as well as the use of such compounds in the preparation of pharmaceutical formulations for the treatment of such conditions.

In general for the treatment as described above, a suitable effective dose of the compound or its pharmaceutically acceptable salt will be in the range of 0.5 to 250 mg per kilogram bodyweight of recipient per day. Administration may be by any suitable route including oral, rectal, nasal, topical (including buccal and sublingual), vaginal or parenteral (including subcutaneous, intramuscular, intravenous and intradermal) administration. It will be appreciated that the preferred route may vary with, for example, the condition, age, and weight of the recipient.

The administered ingredients may be used as a therapy in conjunction with other therapeutic agents, (other anti-virals, anti-bacterials, compounds useful for preventing resulting secondary or contemporaneous afflictions associated with HIV/AIDS) such as AZT, ddI, ddC, 9-[[2-hydroxy-1-(hydroxymethyl)ethoxy]methyl]guanine,

-146-

9-(2-hydroxyethoxymethyl)guanine (acyclovir), 2-amino-9-(2-hydroxyethoxymethyl)purine, suramin, ribavarin, antimoniotungstate (HPA-23), interferon, e.g., a
interferon, interleukin II, and phosphonoformate
5 (Foscarnet) or in conjunction with other immune modulators including bone marrow or lymphocyte transplants or other medications such as levamisole or thymosin which would increase lymphocyte numbers and/or function as is appropriate.

10 For example, in an evaluation of the combination of AZT and a compound of the formula

15 a synergistic effect was observed. The combination was evaluated against HIV-1 in CEM cells using the technique of Prichard and Shipman (*Antiviral Research*, 14, 181-206 (1990)). The peak of synergy was observed at 0.5 µg/ml of the compound of the formula above and 0.005 µg/ml of AZT.

20 While it is possible for the administered ingredients to be administered alone, it is preferable to present them as part of a pharmaceutical formulation. The formulations of the present invention comprise at least one administered ingredient, as above-defined together with one
25 or more acceptable carriers thereof and optionally other therapeutic ingredients. The carrier(s) must be "acceptable" in the sense of being compatible with the

-147-

other ingredients of the formulation and not deleterious to the recipient thereof.

The formulations include those suitable for oral, rectal, nasal, topical (including buccal and sublingual), vaginal or parenteral (including subcutaneous, intramuscular, intravenous and intradermal) administration. The formulations may conveniently be presented in unit dosage form, e.g., tablets and sustained release capsules, and may be prepared by any methods well known in the art of pharmacy.

Such methods include the step of bringing into association the to be administered ingredients with the carrier which constitutes one or more accessory ingredients. In general, the formulations are prepared by uniformly and intimately bringing into association the active ingredients with liquid carriers or finely divided solid carriers or both, and then if necessary shaping the product.

Formulations of the present invention suitable for oral administration may be presented as discrete units such as capsules, cachets or tablets each containing a predetermined amount of the active ingredient; as a powder or granules; as a solution or a suspension in an aqueous liquid or a non-aqueous liquid; or as an oil-in-water liquid emulsion or a water-in-oil liquid emulsion and as a bolus, etc.

With regard to compositions for oral administration (e.g. tablets and capsules), the term "suitable vehicle" means common excipients such as binding agents, for example, syrup, acacia, gelatin, sorbitol, tragacanth, polyvinylpyrrolidone (Povidone),

-148-

methyleellulose, ethyleellulose, sodium carboxy-
methyleellulose, hydroxypropylmethyleellulose, sucrose and
starch; fillers and carriers, for example corn starch,
gelatin, lactose, sucrose, microcrystalline cellulose,
5 kaolin, mannitol, dicalcium phosphate, sodium chloride and
alginic acid; disintegrators such as microcrystalline
cellulose, corn starch, sodium starch glycolate, alginic
acid; and lubricants such as magnesium stearate and other
metallic stearates, stearic acid, silicone fluid, talc,
10 waxes, oils and colloidal silica. Flavoring agents such as
peppermint, oil of wintergreen, cherry flavoring or the
like can also be used. It may be desirable to add a
coloring agent to make the dosage form more aesthetically
pleasing in appearance or to help identify the product.
15 The tablets may also be coated by methods well known in the
art.

A tablet may be made by compression or molding,
optionally with one or more accessory ingredients.
Compressed tablets may be prepared by compressing in a
20 suitable machine the active ingredient in a free-flowing
form such as a powder or granules, optionally mixed with a
binder, lubricant, inert diluent, preservative, surface-
active or dispersing agent. Molded tablets may be made by
molding in a suitable machine a mixture of the powdered
25 compound moistened with an inert liquid diluent. The
tablets may optionally be coated or scored and may be
formulated so as to provide slow or controlled release of
the active ingredient therein.

Formulations suitable for topical administration
30 include lozenges comprising the ingredients in a flavored
basis, usually sucrose and acacia or tragacanth; pastilles

-149-

comprising the active ingredient in an inert basis such as gelatin and glycerin, or sucrose and acacia; and mouthwashes comprising the ingredient to be administered in a suitable liquid carrier.

5 Formulations suitable for topical administration to the skin may be presented as ointments, creams, gels and pastes comprising the ingredient to be administered and a pharmaceutically acceptable carrier. An exemplary topical
10 delivery system is a transdermal patch containing the ingredient to be administered.

Formulations for rectal administration may be presented as a suppository with a suitable base comprising, for example, cocoa butter or a salicylate.

15 Formulations suitable for nasal administration wherein the carrier is a solid include a coarse powder having a particle size, for example, in the range 20 to 500 microns which is administered in the manner in which snuff is taken, i.e., by rapid inhalation through the nasal
20 passage from a container of the powder held close up to the nose. Suitable formulations wherein the carrier is a liquid, for administration, as for example, a nasal spray or as nasal drops, include aqueous or oily solutions of the active ingredient.

25 Formulations suitable for vaginal administration may be presented as pessaries, tampons, creams, gels, pastes, foams, or spray formulations containing in addition to the active ingredient such carriers as are known in the art to be appropriate.

30 Formulations suitable for parenteral administration include aqueous and non-aqueous sterile injection solutions which may contain anti-oxidants,

-150-

buffers, bacteriostats and solutes which render the formulation isotonic with the blood of the intended recipient; and aqueous and non-aqueous sterile suspensions which may include suspending agents and thickening agents.

5 The formulations may be presented in unit-dose or multi-dose containers, for example, sealed ampules and vials, and may be stored in a freeze-dried (lyophilized) condition requiring only the addition of the sterile liquid carrier, or example water for injections, immediately prior to use.
10 Extemporaneous injection solutions and suspensions may be prepared from sterile powders, granules, and tablets of the kind previously described.

Preferred unit dosage formulations are those containing a daily dose or unit, daily sub-dose, as herein
15 above recited, or an appropriate fraction thereof, of the administered ingredient.

The antiviral compounds of Formula I can be used as surface disinfectants. Solutions containing as little as 0.1 percent by weight of the antiviral compound maybe
20 effective for disinfecting purposes. Preferably, such solutions also can contain a detergent or other cleansing agent. The solutions maybe useful for disinfecting objects such as glassware, dental and surgical instruments, and surfaces such as walls, floors, and tables in areas where
25 maintenance of sterile conditions is important, for example, hospitals, food-preparation areas, and the like.

In practicing the method for treating or inhibiting HIV and/or AIDS, the antiviral can be administered in a single daily dose or in multiple doses
30 per day. The treatment regime may require administration over extended periods of time, e.g., for several days or

-151-

for several months or years. The amount administered per dose or the total amount administered will depend on such factors as the nature and severity of the infection, the age and general health of the patient, the tolerance of both the patient and the microorganism or microorganisms involved in the infection to the antiviral compound.

The following formulation examples represent specific pharmaceutical formulations employing compounds comprehended by the present method. The formulations may employ as active compounds any of the compounds of Formula I or a pharmaceutically acceptable salt thereof. The examples are illustrative only and are not intended to limit the scope of the invention in any way.

10	Sodium carboxymethyl starch	4.5 mg
	Magnesium stearate	0.5 mg
	Talc	1 mg

The active ingredient, starch and cellulose are passed through a No. 45 mesh U.S. sieve and mixed thoroughly. The solution of polyvinylpyrrolidone is mixed with the resultant powders which are then passed through a No. 14 mesh U.S. sieve. The granules so produced are dried at 40°-60°C and passed through a No. 18 mesh U.S. sieve. The sodium carboxymethyl starch, magnesium stearate and talc, previously passed through a No. 60 mesh U.S. sieve, are then added to the granules which, after mixing, are compressed on a tablet machine to yield tablets each weighing 150 mg.

To a solution of 1.8 g (10 mmol) 1,1'-thiocarbonyldiimidazole in CH₂Cl₂ (30 ml) at 0°C was added 1.46 ml (10 mmol) of 2-methoxyphenethylamine. The solution was then stirred for 1 hour. After the addition of hexane, the reaction mixture was filtered and evaporated. The residue was dissolved in DMF (8 ml) and 1.0 g (10 mmol) 2-aminothiazole (Merck) was added. The reaction mixture was heated at 100°C for about 16 h. Thereafter, EtOAc and diluted HCl-solution were added. The organic phase was separated and washed with diluted HCl-solution, sat. NH₄Cl-solution and water (x 2), respectively. After drying over Na₂SO₄, the product was purified on a silica gel column, using hexanes/EtOAc (2:1) as eluent, to give 0.77 g crude product. Recrystallization from toluene gave 0.54 g of still crude titled product. A final purification was achieved by the use of a Al₂O₃ column eluted with CHCl₃ (containing 0.5% EtOH) as the eluent. This gave 85 mg of the titled product.

Example 115N-(2-(2-thienyl)ethyl)-N'-(2-thiazolyl)thiourea

6.4 g 2-(2-thienyl)ethanol (50 mmoles) was dissolved in 50 ml diethyl ether together with 3.95 g pyridine (50 mmoles).

-246-

The mixture was cooled to -30°C , and 5.7 g methanesulfonylchloride (50 mmoles) was added dropwise under stirring. The reaction mixture was then heated and kept at reflux temperature for 30 minutes. The mixture was then cooled to room temperature and filtered. The filtrate was transferred to an autoclave together with 100 ml of a solution of ammonia in methanol (saturated at 0°C). The autoclave was sealed and heated to 150°C for 17 hours. The solvent was removed by evaporation in vacuo, and 100 ml 5 M sodium hydroxide in water was added. The mixture was extracted twice with 100 ml methylene chloride to give a solution of 2-(2-thienyl)ethylamine together with some secondary amine.

The pure primary amine was obtained by fractional crystallization from methanol of the salts with oxalic acid, followed by addition of aqueous sodium hydroxide and extraction with methylene chloride.

500 mg of the pure 2-(2-thienyl)ethylamine (3.93 mmole) was added to a solution of 800 mg thiocarbonyl-diimidazole (4.5 mmole) in 5 ml methylene chloride at 0°C . The mixture was stirred at 0°C for 15 minutes, and then 1 hour at 20°C . The solvent was removed in vacuo, and 5 ml dimethylformamide and 500 mg 2-aminothiazole was added. This mixture was allowed to react 17 hours at 110°C . After evaporation of solvent in vacuo 100 ml ethyl acetate was added, and the mixture was heated to 50°C . The warm mixture was washed twice with 20 ml 1 M HCl, and once with 20 ml H_2O . Evaporation of solvent to a small volume gave crystals of the desired product. Recrystallization twice from ethyl acetate gave 340 mg of very pure product.

20 N-(2-(3,4,5-trimethoxy)-benzyl)-N'-(2-
 thiazolyl)thiourea

 The starting material 3,4,5-
trimethoxybenzylamine was prepared by reduction of
3,4,5-trimethoxybenzonitrile with cobalt chloride and
25 sodium borohydride, according to the general method
described by L.S.Heinzman in *J. Am. Chem. Soc.*, 104,
p. 6801 (1980).

 3,4,5-trimethylbenzonitrile (965 mg, 5
mmole) and cobalt chloride (2.37 g, 10 mmole) were
30 dissolved in methanol (70 ml). To the solution was

-469-

added sodium borohydride (1.89 g, 50 mmole). After 3 hrs, the reaction mixture was filtered through Celite, and concentrated to small volume. It was then taken up in chloroform and extracted with 1N HCl (100 ml).

5 The organic phase was discarded. The aqueous phase was basified with aqueous ammonia, and extracted with chloroform. The organic phase was dried over magnesium sulfate, and evaporated in vacuo to yield 3,4,5-trimethoxybenzylamine (427 mg).

FURTHER INFORMATION CONTINUED FROM THE SECOND SHEET

V. ☒ OBSERVATIONS WHERE CERTAIN CLAIMS WERE FOUND UNSEARCHABLE¹

This international search report has not been established in respect of certain claims under Article 17(2) (a) for the following reasons:

1. ☒ Claim numbers 1-15, 27-47, because they relate to subject matter not required to be searched by this Authority, namely:

See PCT Rule 39.1(iv): Methods for treatment of the human or animal body by surgery or therapy, as well as diagnostic methods.

2. ☒ Claim numbers 16, 21, 48, 57 because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

Due to the very broad range of the claims which include a large number of compounds, the search has been essentially restricted to the examples in tables A1-A5.

3. ☐ Claim numbers because they are dependent claims and are not drafted in accordance with the second and third sentences of PCT Rule 6.4(a).

VI. ☐ OBSERVATIONS WHERE UNITY OF INVENTION IS LACKING²

This International Searching Authority found multiple inventions in this international application as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims of the international application.
2. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims of the international application for which fees were paid, specifically claims:
3. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims. It is covered by claim numbers:
4. ☐ As all searchable claims could be searched without effort justifying an additional fee, the International Searching Authority did not invite payment of any additional fee.

Remark on Protest

- ☐ The additional search fees were accompanied by applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
